

DATADNA DATASET

CHALLENGE

GLOBAL AI ADOPTION WORKFORCE DISPLACEMENT
INDEX ANALYTICS CHALLENGE

- JUNE 2026

SPONSORS

datadna.onyxdata.co.uk

HOW TO PARTICIPATE

1 - Scan the QR code and download the dataset.

2 - Visualise the dataset using any tool of your choice.

HOW TO SUBMIT YOUR ENTRY TO THE MAIN CHALLENGE

- 1 - Follow Onyx Data on LinkedIn
(it's ok if you already follow Onyx Data).
- 2 - Share a LinkedIn post on your profile with your visualisation image and tag directly using @ mention to @OnyxData, @Smart Frames UI, @AzureLearn AI Community, @Data Career Jumpstart and the hashtag #dataDNA.
- 3 - In your post, share an image of your visualisation or dashboard
(remember, it must be a single image).
- 4 - Complete the entry form.

CONTEXT

In this challenge, you'll step into the role of a Labour Market Analyst at a global think tank, using workforce, AI adoption, employment, and reskilling data to uncover patterns that shape the future of work.

You'll analyse trends across AI adoption, workforce displacement, job creation, reskilling investment, industries, skill categories, and countries between 2021 and 2024 to identify emerging labour market risks, workforce transformation patterns, investment gaps, and regional differences in AI readiness.

Your goal is to deliver a clear, data-driven analytical report that helps policymakers, governments, employers, and international organisations prioritise reskilling investment, strengthen workforce resilience, improve labour market outcomes, and support evidence-based decisions through actionable insights.

ANALYSIS DIRECTION

Use this dataset to build an analytical report or dashboard.

Your analysis should explore:

- How AI adoption rates, workforce displacement, job creation, and reskilling investment change over time.
- Which countries, industries, and skill categories experience the highest AI adoption, displacement risk, and workforce transformation.
- What separates high-performing and resilient labour markets from those experiencing significant workforce disruption.
- How employment outcomes (jobs created versus jobs displaced) vary across industries, countries, and skill categories throughout the AI era.
- Whether country characteristics (development status, digital infrastructure, AI policy maturity, STEM talent availability) are linked to AI adoption, displacement risk, and employment outcomes.
- How dimensions (country, industry, skill category, and time) interact to influence AI adoption, workforce resilience, and reskilling investment.
- Where disparities, investment gaps, emerging workforce risks, or significant AI-driven labour market shifts exist.
